QA Week 2 Report

Tester: Romit Tejani (0476882), QA / Tester **Project:** Team 3 Home Decor E-Commerce Website **Build tested:** Developer Week 2 update on `main` (Omkumar Patel): admin sign-in and sign-out, new shop theme **Report date:** 8 November 2026 **Hours spent:** 6.5 hours (reading the developer report and code review 1.5; writing test cases 1.5; writing automated QA tests 1.5; running tests and build 0.5; browser testing 1.0; bug log and report 0.5) **Test environment:** Windows laptop, Node 24, Angular dev server on http://localhost:4200, API on http://127.0.0.1:3000, SQLite sample data (3 products, 14 option combinations)

1. Scope

Tested the Week 2 features from the developer report: admin sign-in / sign-out, the new shop and admin theme, and the stock display ("View options and stock"). Also re-tested the two Week 1 bugs.

Not in scope (not built yet): editing products and stock, search, filters, cart, checkout, orders, payments.

2. Approach

Following the proposal's QA plan (slide 8): plan test cases, run tests, log bugs, retest fixes. The developer's own results are treated as input, not as QA approval.

- Read the developer report, README and code (`admin.js` , `app.js` , `admin.component.ts` , `app.component.html` , `styles.css` , `schema.sql`).
- Wrote 31 test cases (`QA_Test_Plan_and_Results_Increment1.xlsx`), continuing from Week 1 (TC-24 to TC-54).
- Wrote automated QA tests: `apps/api/test/qa-admin.test.js` (14 admin tests) and `apps/api/test/qa-regression.test.js` (8 database tests).
- Re-ran the Week 1 bug checks on the Week 2 code, checked colour contrast from the theme CSS, and checked `.gitignore` behaviour in a test repository.
- Ran `npm test` and `npm run build` on Node 24 (Windows).
- Ran the manual browser tests: sign-in, sign-out, wrong password, refresh and Back behaviour, options button and stock display, zero-stock labels, mobile widths, keyboard use, error/retry, and a second browser.

3. Results so far

Measure	Count
Test cases written	31
Passed	26
Failed	3
Observations	2
Not yet run	0

Automated run on Node 24 (Windows), `npm test`: 28 tests, 24 pass, 0 fail, 4 `todo`. The `todo` tests are the known bugs (BUG-01a, b, c and BUG-03) and fail as expected. `npm run build` succeeded.

Passed: Developer's 5 tests (re-run independently); build; admin access checks - admin disabled without a password or with a short one, guest/forged/malformed cookies rejected, bad sign-in input rejected, X-Admin-Request header required, cookie flags correct, 30-minute expiry, 429 after 5 failures, sign-out ends the session, public catalogue exposes no admin data and has no write routes; no hard-coded secrets; theme text contrast (lowest text ratio 5.1:1); all 13 manual browser tests (sign-in form, wrong password, sign-in, refresh, sign-out and Back, API restart, options and stock display, out-of-stock labels, mobile widths, keyboard use, error/retry, artwork loading, second browser).

Failed: Week 1 bugs BUG-01 and BUG-02 are still present (TC-26, TC-27); BUG-03 confirmed in the admin lockout (TC-41). BUG-02 was found by code review and still needs a browser confirmation.

Developer report claims: "five automated tests pass" and "build passes" are confirmed. The browser checks the developer asked for (sign-in, sign-out, wrong password, View options and stock) also passed in QA browser testing.

3a. Check against the proposal's completion checks (slide 8)

Completion check	Status this week
Required features work	Not complete: admin sign-in and the stock display are built; product/stock editing, search, cart and checkout are not built yet.
Totals and stock are correct	Stock data checked at database level (35 / 20 / 11 across the three products) and stock cannot go below zero. Order totals cannot be tested until checkout exists.
Admin access is protected	API checks pass (guests, forged cookies, missing header, expiry, sign-out). Browser checks pass. BUG-03 (global lockout) needs a fix.

4. Issues found

ID	Title	Severity	Status
BUG-01	Schema allows variants with no options, duplicate combinations, or options from another product	Medium	Open, still reproducible
BUG-02	Unavailable products still shown (page ignores the flag)	Low now, higher once admin edits products	Open, still present
BUG-03	Admin lockout counter is global: 5 failures from anyone block the real admin, even with the right password	Medium	New
BUG-04	SQLite database file is tracked in Git; `.gitignore` pattern `data/*.sqlite*` does not match `apps/api/data/`	Low now, Medium once stock is editable	New

Observations: OBS-05 (Node version check in README), OBS-07 (Admin link visible to customers), OBS-08 (Week 2 pushed straight to main without review), OBS-09 (admin page does not notice an expired session). Details and reproduction steps are in `Bug_Log.md`.

5. Risks

- BUG-01 still affects the planned "two requests for the last item, only one order succeeds" test, because stock is stored per option combination.
- BUG-04 will become a team problem once admins can edit stock: stock edits will change a tracked file and cause merge conflicts.
- Product and stock editing, planned next by the developer, will depend on the admin session. Session expiry handling (OBS-09) and the lockout behaviour (BUG-03) should be settled first.
- BUG-02 and BUG-04 were found by code review and a test repository; both still need confirming on the real project (browser and `git ls-files`).

6. Next tasks

1. Confirm BUG-02 in the browser and BUG-04 with `git ls-files apps/api/data`.
2. Report BUG-01 to BUG-04 to Omkumar; retest after fixes. Share OBS-07 and OBS-08 with Nir.
3. Prepare test cases for product/stock editing (admin-only access, validation, stock cannot go below zero) before it is built.
